

PHP Code

```
class Airplane
{
    var $model;
    function __construct($handle = "Piper
Cub")
    {
        $this->model = $handle;
    } // end constructor

    function setModel($newModel)
    {
        $this->model = $newModel;
    } // end setModel

    function getModel()
    {
        return $this->model;
    } // end getModel
} // end Airplane class
```

```
$thePlane = new Airplane();

print "Original model: " .
    $thePlane->getModel() . "<br
/>\n";
```

```
print "Upgrading the fleet...<br
/>\n";

$thePlane->setModel("McDonnell
Douglas DC-10");

print "Upgraded fleet: " .
    $thePlane->getModel() . "<br
/>\n";
```

PHP Server's Memory

\$thePlane is created as an object
of class (type) Airplane.

The \$model property is assigned
the default value "Piper Cub".

The \$model property is assigned
the new value "McDonnell
Douglas DC-10".

HTML Page's Display

Original model: Piper Cub

Upgrading the fleet...
